

CUSTOM CLAIMS to AzureAD

Jamf Connect Integration Guide

onpremisesamaccountname · Azure AD Custom Claims · OIDC Configuration

CREATED BY

Ryan Adams

CATEGORY

Identity / PKI

PLATFORM

Jamf Pro + Azure AD

WHAT THIS GUIDE COVERS

- Install AzureADPreview module via PowerShell
- Download & modify the Jamf Connect app manifest
- Test and verify via Jamf Connect Configuration app
- Map Jamf variable for Menubar via Azure AD IDP
- Run the custom claims setup script from GitHub
- Edit acceptMappedClaims in the .json file
- Configure OIDC Short Name for onpremisesamaccountname
- Create Smart Group for scoped profile deployment

Requirements & Setup

REQUIREMENTS

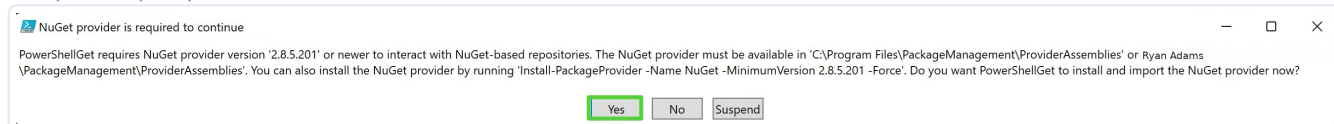

- Windows desktop with admin rights
- Global Admin rights in Azure AD

1 Open PowerShell as Administrator

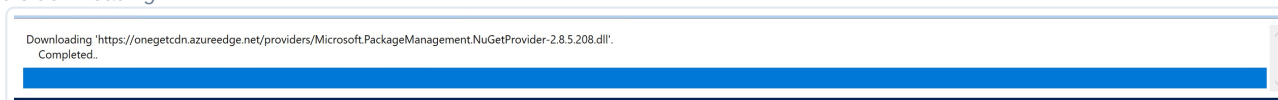

Run this command to install the AzureADPreview module:

```
Install-Module -Name AzureADPreview -RequiredVersion 2.0.2.149
```

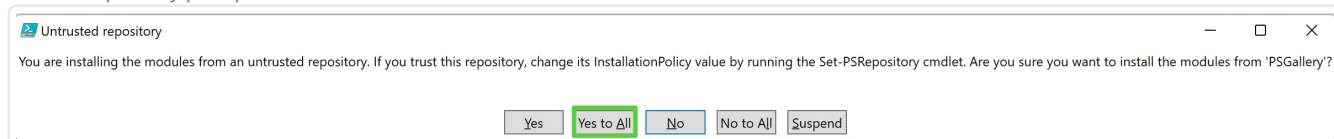

NuGet provider prompt - click Yes:

Module downloading:

Untrusted repository prompt - click Yes to All:

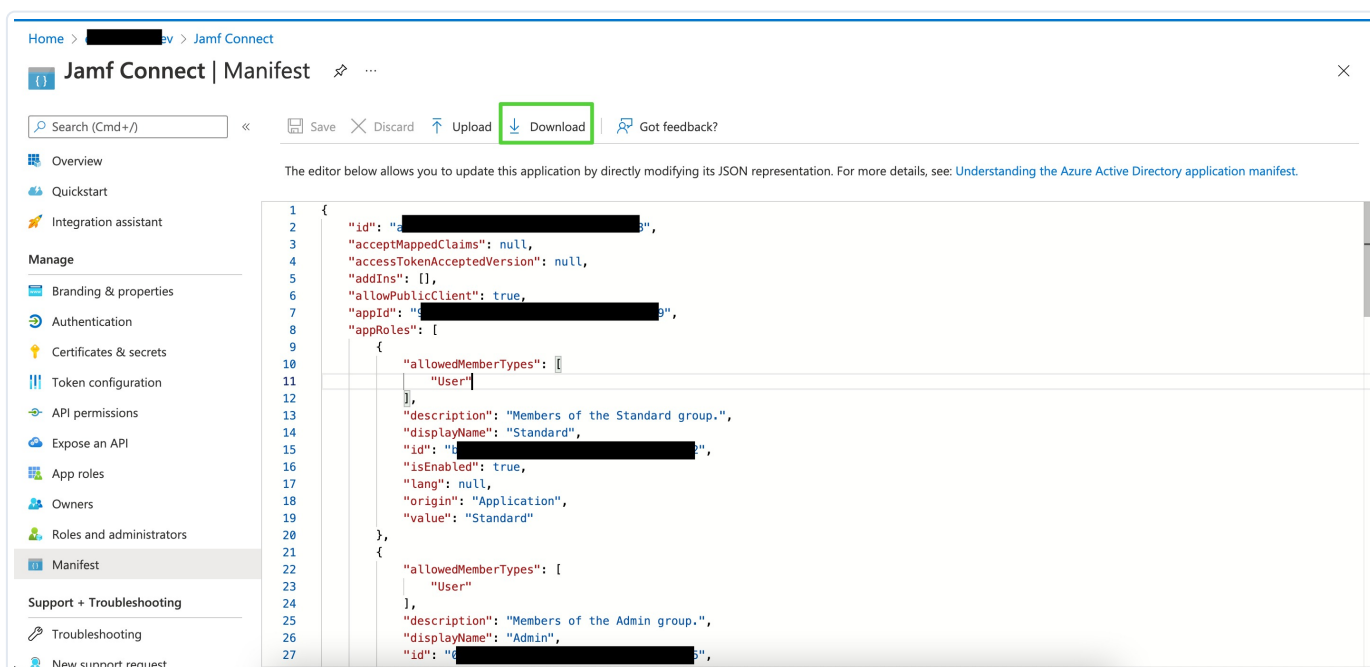

2 Download & Run the Custom Claims Script

Download this script from GitHub and run it in PowerShell as Administrator.

3 Download the Jamf Connect App Manifest from Azure AD

In the Azure portal, navigate to your Jamf Connect app registration and download the manifest file.

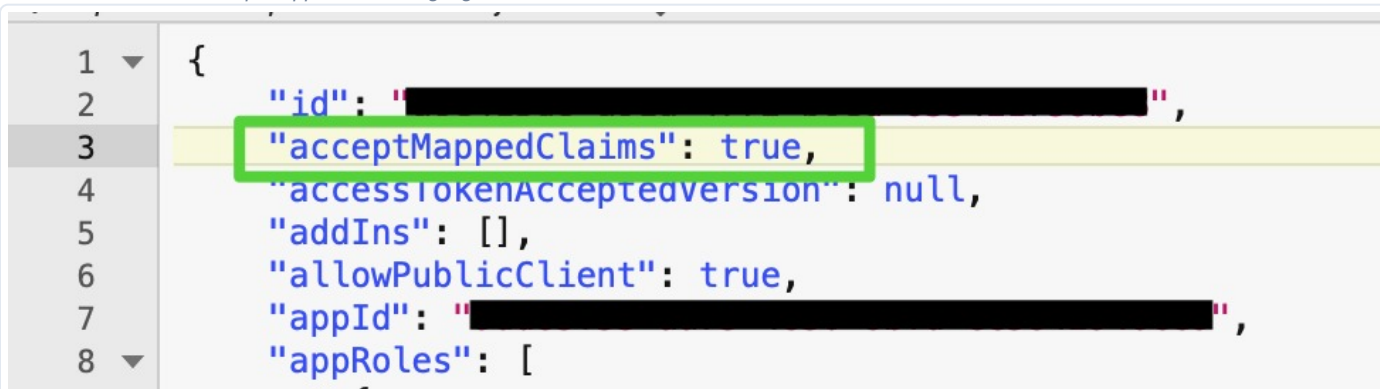

Configuration & Verification

4 Edit the Manifest .json File

Open the downloaded .json file in a text editor (e.g. BBEdit) and set this value:

```
"acceptMappedClaims": true,
```

Manifest JSON with `acceptMappedClaims` highlighted:

5 Test via Jamf Connect Configuration App

Test Jamf Connect Login via the Jamf Connect Configuration app and verify the `onpremisesamaccountname` claim appears in the OIDC token.

6 Set the OIDC Short Name in Jamf Connect Login Config

Once verified, add the following key to your Jamf Connect Login configuration profile:

```
<key>OIDCShortName</key>
<string>onpremisesamaccountname</string>
```

Jamf Connect Short Name field and plist configuration:

Short Name

The attribute from a user's ID token to use as the account short name. The short name is added as an alias to the user's local account. /nNote: If the attribute you want to use is not in the standard ID token sent by Okta, you can receive additional attributes in an ID token by specifying additional claims with the "OpenID Connect Scopes" setting.

Further Reading

This guide demonstrates the onpremisesamaccountname claim. You can add other values from the Azure Graph API - see the full user resource reference:

<https://learn.microsoft.com/en-us/graph/api/resources/user?view=graph-rest-1.0>

Jamf Connect Menubar

The Menubar cannot use a claim value directly. Instead, map the value to a Jamf variable such as \$ROOM. In your Azure AD IDP mappings, set Room to onPremisesSamAccountName.

Azure AD IDP attribute mapping (Room → onPremisesSamAccountName):

Room

onPremisesSamAccountName

Then exclude the Jamf Connect Menubar config from the pre-stage. Create a Smart Group to control its scope:

Smart Group Name: *Room Not Assigned*

Smart Group criteria (Criteria tab - Room is [blank]):

Computer Group	Criteria
AND/OR	CRITERIA
	OPERATOR
	VALUE
▼	Room
	is

Set the scope for the Jamf Connect Menubar config profile to: All Computers | Excluded: Room Not Assigned
